

Evidence of Abnormal Calcium Deposits Potentially Linked to Environmental Toxins

BENIGN TODAY? NYC Imaging Detective Finds Abnormal Skin Disorder in Some Chelation Patients

January 21, 2021- A recent review of a percentage of patients formerly showing elevated traces of HEAVY METALS in the bloodstream now appear to show latent presence of calcium deposits under the skin. These concerning reactions particularly from patients with raised-to-high ARSENIC and MERCURY levels (indicated in the patients' blood tests) appear as significant tissue disorientation as a result of heavy calcium buildup within the dermal area as shown from ultrasound imaging scans.

In a recent study, Dr. Robert Bard of the Bard Diagnostic Imaging Center (NYC) uncovered a significant pattern of patients with skin lesions in the face and arms, and through the use of advanced ultrasound scanning, found unsuspected micro-calcific pockets in the intradermal tissues. Deeper scans using 3D imaging of subdermal calcification showed further presence of calcium deposition. The soft tissues were scanned with 4D imaging to quantify these tissue abnormalities.

Further studies are now being performed at Dr. Bard's research facility where he is collaborating with top experts in the field of dermatopathology. "Complex biopsies and other diagnostic analyses are being considered to explore the life cycle of these calcium deposits since we learned from environmental disasters like 9/11 that what was once benign, years later, shows grave new "surprises" -including cancers. Throughout my career as clinical radiologist, I take nothing for granted... especially when things that [even] appear to be related to the biological exposure of toxins." 2021 ANNOUNCEMENT FOR OUR PATIENTS

Staying on top of your health is paramount- especially in our current health crisis. New innovations in patient care technologies helps maintain our promise to support all our patients vital needs. Another recent upgrade to our practice is the virtual imaging partnership with renowned radiologist DR. ROBERT BARD, top diagnostic expert in NYC. His imaging facility (cancerScan.com) is our NEW health resource for our patients diagnostic imaging needs- including the recent findings and growing concerns about skin calcification in patients with elevated metals (see above article).
